

Installing BattleCode Viewer (2018)

COSC 370 – Artificial Intelligence

Updated: March 13, 2019

- 1.) Start Docker and navigate to your Battlecode scaffold directory.
- 2.) Run the following command:

```
python ./install_viewer.py
```

- 3.) Choose the appropriate operating system.
- 4.) Type Y when prompted to update to the newest version.
- 5.) Wait.
- 6.) Once installed, navigate to your Battlecode scaffold directory in the Windows filesystem or Finder or whatever it is on Linux (not within Docker!), then go to the viewer_latest directory, then to your OS type, and then run the application located in that directory.
- 7.) The viewer is for the replaying of games, so you have to have a replay file to view it. Once you have run a game in the Battlecode simulator. Once you have that, start the viewer application, hit Play, click on the three bars located here, select your file, and then hit the play button to view your replay. Controls for the viewer are noted in the first window when you launch the application, but the most useful is page up/page down to zoom in and out.
